

Build a Job Portal Admin API with the following requirements:

User Role Types:

1. Job Seeker
2. Job Poster (Company/Employer)
3. Business Promoter

A single user can have multiple roles:

User roles should be stored in a separate table, not in the main user table. User IDs and role mappings must be managed through dedicated role-related tables.

❖ **Job Seeker Features:**

- Job search is free until 03 applies.
- Thereafter, all applies will be chargeable.
- Premium services will be available through purchase of subscription based on daily, weekly, or monthly basis.

❖ **Company/Employer Features:**

- Companies can post up to 3 jobs for free.
- Thereafter, all job postings will be chargeable.
- Premium services will be available through purchase of subscription based on daily, weekly, or monthly basis.

❖ **Business Promotion Features:**

- Users with the Business Promoter role can promote their business on the platform.
- Business promotion is a **paid feature**.
- Promoted businesses should be displayed on the website for a configurable number of days.
- The promotion duration should be managed by the admin.

❖ **Admin Panel:**

- Only Super Users can access the admin panel.
 - Admins can:
 - Manage users and roles.
 - Manage job postings.
 - Manage job applications.
 - Approve and manage business promotions.
 - Configure promotion duration and visibility.
 - Monitor platform activity and reports.

❖ Database Design Notes:

- Keep user information in the `users` table.
- * Store roles in a separate `roles` table.
- * Maintain user-role relationships in a `user\_roles` table to support multiple roles per user.
- * Use role-based access control (RBAC) throughout the system.
